

MAMMALS

MAMMAL COLLECTIONS

SKINS:

These are in phylogenetic order according to families, genera, species, and subspecies. Examples of species (if not polytypic) and subspecies are grouped by locality.

In general the skins are arranged in the trays beginning at the left corner and running backwards, with subsequent rows all starting at the front of the tray. This, of course, is modified in some cases where the size and shape of the skins impede easy arrangement.

A few of the larger forms, particularly carnivores and hoofed mammals, are placed in the drawers beneath the cases. These drawers are arranged phylogenetically from left to right.

SKULLS:

The skull, if one exists, will be found in the same tray as the skin. In the case of a skull with no skin, if the subspecies is known, it will be placed in the first tray containing that form. If only the species is known, it will be placed in the first tray containing that species. A similar plan is followed for all supraspecific groups.

All skulls are arranged numerically in a given tray regardless of phylogenetic position!!!

The skulls of the larger mammals will be found in the glass cases above the mammal cases. These are arranged numerically.

MASSAL PREPARATION

SKINS:

These are in systematic order according to families, genera, species, and sub-species. Examples of species (if not sub-species) and sub-species are grouped by locality.

In general the skins are arranged in the trays beginning at the left corner and running backwards, with independent rows all starting at the front of the tray. This, of course, is modified in some cases where the size and shape of the skins impose any arrangement.

A few of the larger forms, particularly carnivores and hooved mammals, are placed in the drawers beneath the cases. These drawers are arranged physiologically from left to right.

SKULLS:

The skull, if one exists, will be found in the same tray as the skin. In the case of a skull with no skin, if the sub-species is known, it will be placed in the first tray containing that form. If only the species is known, it will be placed in the first tray containing that species. A similar plan is followed for all representative groups.

All skulls are arranged numerically in a given tray regardless of physiologic position!!!

The skulls of the larger mammals will be found in the glass cases above the mammal cases. These are arranged numerically.
